CARBON DIOXIDE (CO\textsubscript{2}) LASER SURGERY
SKIN RESURFACING

The term “LASER” stands for Light Amplification by the Stimulated Emission of Radiation. A laser is a special light beam that can be precisely focused and is used to treat tissues by heating the targeted cells until they “burst.” Laser treatment can: 1) destroy diseased tissues (such as tumors), 2) seal small blood vessels (coagulation) to reduce blood loss, 3) reduce scarring normally associated with non-laser surgeries, and 4) be used for cosmetic purposes including removal of tattoos or birthmarks and skin resurfacing.
