MAMMOGRAPHY FOR PATIENTS WITH BREAST IMPLANTS

Patient’s Initials

Your physician has recommended that you have a mammogram. This procedure is currently the best way to detect a cancer of the breast that cannot be detected by breast palpation (manual examination).

Breast implants can interface with the interpretation of your mammogram because they obscure some of the breast tissue. However, newer techniques that involve displacement of the implants allow for a good examination. To provide adequate displacement of the implant, it is necessary to apply pressure with the mammography machine to the breast and the implant. This pressure may be uncomfortable, but it is essential to the examination.

While thousands of implant patients have undergone successful mammography without problems, there have been reports of occasional rupture of the implants that may not be detected immediately and may require surgical replacement. Although our technicians are aware of this possibility and take utmost care in their technique, you should be aware that there is some risk of a rupture occurring.

Implants that have been in place for a number of years may be more vulnerable. However, since the risk of an implant rupture is far less than the risk of a breast cancer, a mammogram is necessary to protect a woman’s health.

I certify that I have read and understand this treatment agreement and that all blanks were filled in prior to my signature.

I authorize and direct ________________, MD, with associates or assistants of his or her choice, to perform the mammography on ______________________ at ___________________.

(Patient Name)   (Facility Name)

☐ right breast  ☐ left breast  ☐ both
